# Social Page

Screenshots of the vertically sliced feature in the deployed app

Description of the development and integration with the app, use links to GitLab for code commits.

This is the social page of our app, which includes adding friends, searching for friends, deleting friends, showing friends, showing users of recent games, showing the friend application list, and accepting or rejecting friend applications. The screenshots show you getting information about the current user from URL, you can add friends by id, but you can't add yourself or people who are already friends or have sent a friend request. To search for friends, you can enter the username to get a specific user and display it. If you do not search for all the current user's friends, all the current user's friends will be displayed, and you can delete the friends. Users who have played with each other recently can be displayed with the current user, which shows other users in the game according to the latest time when the user finished the game and does not show users who are already friends and users who have sent friend requests. A friend request is used to send a friend request. The user who receives the friend request can accept or reject the friend request from user.
